**Challenge.** Guarantee performance.

**This lecture.** 2-3 trees, left-leaning red-black BSTs, B-trees.
3.3 Balanced Search Trees

- 2-3 search trees
- red-black BSTs
- B-trees
2-3 tree

Allow 1 or 2 keys per node.
- 2-node: one key, two children.
- 3-node: two keys, three children.

Symmetric order. Inorder traversal yields keys in ascending order.
Perfect balance. Every path from root to null link has same length.
Search.

- Compare search key against keys in node.
- Find interval containing search key.
- Follow associated link (recursively).

**search for H**
Insertion into a 2-3 tree

Insertion into a 2-node at bottom.
- Add new key to 2-node to create a 3-node.
Insertion into a 2-3 tree

Insertion into a 3-node at bottom.
- Add new key to 3-node to create temporary 4-node.
- Move middle key in 4-node into parent.
- Repeat up the tree, as necessary.
- If you reach the root and it's a 4-node, split it into three 2-nodes.

S X
Local transformations in a 2-3 tree

Splitting a 4-node is a local transformation: constant number of operations.
Global properties in a 2-3 tree

**Invariants.** Maintains symmetric order and perfect balance.

**Pf.** Each transformation maintains symmetric order and perfect balance.
2-3 tree: performance

**Perfect balance.** Every path from root to null link has same length.

**Tree height.**
- Worst case:
- Best case:
2-3 tree: performance

Perfect balance. Every path from root to null link has same length.

Tree height.
- Worst case: $\lg N$. [all 2-nodes]
- Best case: $\log_3 N \approx 0.631 \lg N$. [all 3-nodes]
- Between 12 and 20 for a million nodes.
- Between 18 and 30 for a billion nodes.

Bottom line. Guaranteed logarithmic performance for search and insert.

*constant $c$ depend upon implementation*
Direct implementation is complicated, because:

- Maintaining multiple node types is cumbersome.
- Need multiple compares to move down tree.
- Need to move back up the tree to split 4-nodes.
- Large number of cases for splitting.

```
public void put(Key key, Value val)
{
    Node x = root;
    while (x.getTheCorrectChild(key) != null)
    {
        x = x.getTheCorrectChildKey();
        if (x.is4Node()) x.split();
    }
    if (x.is2Node()) x.make3Node(key, val);
    else if (x.is3Node()) x.make4Node(key, val);
}
```
3.3 Balanced Search Trees

- 2-3 search trees
- red-black BSTs
- B-trees
How to implement 2-3 trees with binary trees?

**Challenge.** How to represent a 3 node?

**Approach 1: regular BST.**
- No way to tell a 3-node from a 2-node.
- Cannot map from BST back to 2-3 tree.

**Approach 2: regular BST with "glue" nodes.**
- Wastes space, wasted link.
- Code probably messy.

**Approach 3: regular BST with red "glue" links.**
- Widely used in practice.
- Arbitrary restriction: red links lean left.
Left-leaning red-black BSTs (Guibas-Sedgewick 1979 and Sedgewick 2007)

1. Represent 2–3 tree as a BST.
2. Use "internal" left-leaning links as "glue" for 3–nodes.
An equivalent definition

A BST such that:
- No node has two red links connected to it.
- Every path from root to null link has the same number of black links.
- Red links lean left.

"perfect black balance"
Left-leaning red-black BSTs: 1-1 correspondence with 2-3 trees

Key property. 1–1 correspondence between 2–3 and LLRB.
Search implementation for red-black BSTs

**Observation.** Search is the same as for elementary BST (ignore color).

```java
public Val get(Key key) {
    Node x = root;
    while (x != null) {
        int cmp = key.compareTo(x.key);
        if (cmp < 0) x = x.left;
        else if (cmp > 0) x = x.right;
        else if (cmp == 0) return x.val;
    }
    return null;
}
```

**Remark.** Most other ops (e.g., floor, iteration, selection) are also identical.
Red-black BST representation

Each node is pointed to by precisely one link (from its parent) ⇒ can encode color of links in nodes.

```java
private static final boolean RED = true;
private static final boolean BLACK = false;

private class Node {
    Key key;
    Value val;
    Node left, right;
    boolean color; // color of parent link
}

private boolean isRed(Node x) {
    if (x == null) return false;
    return x.color == RED;
}
```

null links are black
Basic strategy. Maintain 1-1 correspondence with 2-3 trees.

During internal operations, maintain:
- Symmetric order.
- Perfect black balance.
  [ but not necessarily color invariants ]

How? Apply elementary red-black BST operations: rotation and color flip.
Elementary red-black BST operations

**Left rotation.** Orient a (temporarily) right-leaning red link to lean left.

![Diagram of left rotation]

### Invariants.
Maintains symmetric order and perfect black balance.

```java
private Node rotateLeft(Node h) {
    assert isRed(h.right);
    Node x = h.right;
    h.right = x.left;
    x.left = h;
    x.color = h.color;
    h.color = RED;
    return x;
}
```
Elementary red-black BST operations

**Left rotation.** Orient a (temporarily) right-leaning red link to lean left.

![Tree Diagram]

rotate E left
(after)

private Node rotateLeft(Node h) {
    assert isRed(h.right);
    Node x = h.right;
    h.right = x.left;
    x.left = h;
    x.color = h.color;
    h.color = RED;
    return x;
}

Invariants. Maintains symmetric order and perfect black balance.
Elementary red-black BST operations

Right rotation. Orient a left-leaning red link to (temporarily) lean right.

```
rotate S right
(before)

private Node rotateRight(Node h) {
    assert isRed(h.left);
    Node x = h.left;
    h.left = x.right;
    x.right = h;
    x.color = h.color;
    h.color = RED;
    return x;
}
```

Invariants. Maintains symmetric order and perfect black balance.
Elementary red-black BST operations

Right rotation. Orient a left-leaning red link to (temporarily) lean right.

Invariants. Maintains symmetric order and perfect black balance.
Elementary red-black BST operations

**Color flip.** Recolor to split a (temporary) 4-node.

```
private void flipColors(Node h) {
    assert !isRed(h);
    assert isRed(h.left);
    assert isRed(h.right);
    h.color = RED;
    h.left.color = BLACK;
    h.right.color = BLACK;
}
```

**Invariants.** Maintains symmetric order and perfect black balance.
Elementary red-black BST operations

**Color flip.** Recolor to split a (temporary) 4-node.

```java
private void flipColors(Node h) {
    assert !isRed(h);
    assert isRed(h.left);
    assert isRed(h.right);
    h.color = RED;
    h.left.color = BLACK;
    h.right.color = BLACK;
}
```

**Invariants.** Maintains symmetric order and perfect black balance.
Warmup 1. Insert into a tree with exactly 1 node.

- **Left Case:**
  - Search ends at this null link.
  - Red link to new node containing a converts 2-node to 3-node.

- **Right Case:**
  - Search ends at this null link.
  - Attached new node with red link.
  - Rotated left to make a legal 3-node.
Case 1. Insert into a 2-node at the bottom.

- Do standard BST insert; color new link red.
- If new red link is a right link, rotate left.

To maintain symmetric order and perfect black balance.

To fix color invariants.
Warmup 2. Insert into a tree with exactly 2 nodes.
**Insertion in a LLRB tree**

**Case 2.** Insert into a 3-node at the bottom.
- Do standard BST insert; color new link red.
- Rotate to balance the 4-node (if needed).
- Flip colors to pass red link up one level.
- Rotate to make lean left (if needed).

---

**diagram**

**inserting H**

1. **add new node here**
2. **both children red so flip colors**
3. **right link red so rotate left**
4. **two lefts in a row so rotate right**
5. **to maintain symmetric order and perfect black balance**
6. **to fix color invariants**

---

33
**Case 2.** Insert into a 3-node at the bottom.
- Do standard BST insert; color new link red.
- Rotate to balance the 4-node (if needed).
- Flip colors to pass red link up one level.
- Rotate to make lean left (if needed).
- Repeat case 1 or case 2 up the tree (if needed).
Red-black BST construction demo

insert S
Red-black BST construction demo

red-black BST

![Red-black BST Diagram](image-url)
Insertion in a LLRB tree: Java implementation

Same code for all cases.

- Right child red, left child black: rotate left.
- Left child, left-left grandchild red: rotate right.
- Both children red: flip colors.

```java
class Node {
    Key key;
    Value val;
    boolean isRed; // true if red, false if black

    Node() { isRed = true; }
    Node(Key key, Value val, boolean isRed) {
        this.key = key;
        this.val = val;
        this.isRed = isRed;
    }
}

private Node put(Node h, Key key, Value val) {
    if (h == null) return new Node(key, val, RED);
    int cmp = key.compareTo(h.key);
    if (cmp < 0) h.left = put(h.left, key, val);
    else if (cmp > 0) h.right = put(h.right, key, val);
    else if (cmp == 0) h.val = val;

    if (isRed(h.right) && !isRed(h.left)) h = rotateLeft(h);
    if (isRed(h.left) && isRed(h.left.left)) h = rotateRight(h);
    if (isRed(h.left) && isRed(h.right)) flipColors(h);

    return h;
}
```

Palo Alto, California, and  
*Carnegie-Mellon University*

Robert Sedgewick*  
Program in Computer Science  
*Brown University*  
Providence, R. I.

**ABSTRACT**

In this paper we present a uniform framework for the implementation and study of balanced tree algorithms. We show how to imbed in this

the way down towards a leaf. As we will see, this has a number of significant advantages over the older methods. We shall examine a number of variations on a common theme and exhibit full implementations which are notable for their brevity. One implementation is examined carefully, and some properties about its
War story: red-black BSTs

Telephone company contracted with database provider to build real-time database to store customer information.

Database implementation.
• Red-black BST search and insert; Hibbard deletion.
• Exceeding height limit of 80 triggered error-recovery process.

Extended telephone service outage.
• Main cause = height bounded exceeded!
• Telephone company sues database provider.
• Legal testimony:

“\textit{If implemented properly, the height of a red-black BST with N keys is at most } 2 \log_2 N.\textit{ ”} \quad \textit{— expert witness}
3.3 Balanced Search Trees

- 2-3 search trees
- red-black BSTs
- B-trees
Page. Contiguous block of data (e.g., a file or 4,096-byte chunk).

Probe. First access to a page (e.g., from disk to memory).

Property. Time required for a probe is much larger than time to access data within a page.

Cost model. Number of probes.

Goal. Access data using minimum number of probes.
B-trees (Bayer-McCreight, 1972)

**B-tree.** Generalize 2-3 trees by allowing up to $M - 1$ key-link pairs per node.

- At least 2 key-link pairs at root.
- At least $M/2$ key-link pairs in other nodes.
- External nodes contain client keys.
- Internal nodes contain copies of keys to guide search.

Anatomy of a B-tree set ($M = 6$)

---

choose $M$ as large as possible so that $M$ links fit in a page, e.g., $M = 1024$
Searching in a B-tree

- Start at root.
- Find interval for search key and take corresponding link.
- Search terminates in external node.

Searching in a B-tree set (M = 6)
Insertion in a B-tree

- Search for new key.
- Insert at bottom.
- Split nodes with \( M \) key-link pairs on the way up the tree.
Balance in B-tree

**Proposition.** A search or an insertion in a B-tree of order $M$ with $N$ keys requires between $\log_{M-1} N$ and $\log_{M/2} N$ probes.

**Pf.** All internal nodes (besides root) have between $M/2$ and $M-1$ links.

**In practice.** Number of probes is at most 4. $\quad \rightarrow \quad M = 1024; N = 62$ billion

\[
\log_{M/2} N \leq 4
\]

**Optimization.** Always keep root page in memory.
Building a large B tree

each line shows the result of inserting one key in some page

white: unoccupied portion of page
black: occupied portion of page
full page, about to split
full page splits into two half-full pages then a new key is added to one of them
Balanced trees in the wild

Red-black trees are widely used as system symbol tables.

- Java: java.util.TreeMap, java.util.TreeSet.
- C++ STL: map, multimap, multiset.
- Linux kernel: completely fair scheduler, linux/rbtree.h.
- Emacs: conservative stack scanning.

B-tree variants. B+ tree, B*tree, B# tree, ...

B-trees (and variants) are widely used for file systems and databases.

- Windows: NTFS.
- Mac: HFS, HFS+.
- Linux: ReiserFS, XFS, Ext3FS, JFS.
- Databases: ORACLE, DB2, INGRES, SQL, PostgreSQL.
Red-black BSTs in the wild

Common sense. Sixth sense. Together they're the FBI's newest team.
Red-black BSTs in the wild

ACT FOUR

FADE IN:

INT. FBI HQ - NIGHT

Antonio is at THE COMPUTER as Jess explains herself to Nicole and Pollock. The CONFERENCE TABLE is covered with OPEN REFERENCE BOOKS, TOURIST GUIDES, MAPS and REAMS OF PRINTOUTS.

JESS
It was the red door again.

POLLOCK
I thought the red door was the storage container.

JESS
But it wasn't red anymore. It was black.

ANTONIO
So red turning to black means...
what?

POLLOCK
Budget deficits? Red ink, black ink?

NICOLE
Yes. I'm sure that's what it is. But maybe we should come up with a couple other options, just in case.

Antonio refers to his COMPUTER SCREEN, which is filled with mathematical equations.

ANTONIO
It could be an algorithm from a binary search tree. A red-black tree tracks every simple path from a node to a descendant leaf with the same number of black nodes.

JESS
Does that help you with girls?
