- NFA simulation
- NFA construction
- applications
5.4 Regular Expressions

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications
Pattern matching

Substring search. Find a single string in text.

Pattern matching. Find one of a specified set of strings in text.

Ex. [genomics]

- Fragile X syndrome is a common cause of mental retardation.
- A human's genome is a string.
- It contains triplet repeats of CGG or AGG, bracketed by GCG at the beginning and CTG at the end.
- Number of repeats is variable and is correlated to syndrome.

\[
\text{pattern} \quad \text{GCG (CGG} \mid \text{AGG)} \ast \text{CTG}
\]

\[
\text{text} \quad \text{GCGCGTGTGTGCGAGAGAGTGTTAAGCTGCGGAGGGCTGCGGAGGGCTG}
\]
/**
 * Compilation: javac NFA.java
 * Execution: java NFA regexp text
 * Dependencies: Stack.java Bag.java Digraph.java DirectedDFS.java
 * % java NFA "(A*B|AC)D" AAAABD
 * true
 * % java NFA "(A*B|AC)D" AAAAC
 * false
 *
 */

public class NFA {
    private Digraph G; // digraph of epsilon transitions
    private String regexp; // regular expression
    private int M; // number of characters in regular expression

    // Create the NFA for the given RE
    public NFA(String regexp) {
        this.regexp = regexp;
        M = regexp.length();
        Stack<Integer> ops = new Stack<Integer>();
        G = new Digraph(M+1);
        ...
    }

    GNU source-highlight 3.1.4
Google code search

http://code.google.com/p/chromium/source/search
Pattern matching: applications

Test if a string matches some pattern.
- Scan for virus signatures.
- Process natural language.
- Specify a programming language.
- Access information in digital libraries.
- Search genome using PROSITE patterns.
- Filter text (spam, NetNanny, Carnivore, malware).
- Validate data-entry fields (dates, email, URL, credit card).
  ...

Parse text files.
- Compile a Java program.
- Crawl and index the Web.
- Read in data stored in ad hoc input file format.
- Create Java documentation from Javadoc comments.
  ...
Regular expressions

A regular expression is a notation to specify a set of strings.

<table>
<thead>
<tr>
<th>operation</th>
<th>order</th>
<th>example RE</th>
<th>matches</th>
<th>does not match</th>
</tr>
</thead>
<tbody>
<tr>
<td>concatenation</td>
<td>3</td>
<td>AABAAB</td>
<td>AABAAB</td>
<td>every other string</td>
</tr>
<tr>
<td>or</td>
<td>4</td>
<td>AA</td>
<td>BAAB</td>
<td>AA BAAB</td>
</tr>
<tr>
<td>closure</td>
<td>2</td>
<td>AB*A</td>
<td>AA ABBBBBBBBBA</td>
<td>AB ABABA</td>
</tr>
<tr>
<td>parentheses</td>
<td>1</td>
<td>A(A</td>
<td>B)AAB</td>
<td>AAAAB ABAAB</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(AB)*A</td>
<td>A ABABABABABABA</td>
<td>AA ABBA</td>
</tr>
</tbody>
</table>
Regular expression shortcuts

Additional operations are often added for convenience.

<table>
<thead>
<tr>
<th>operation</th>
<th>example RE</th>
<th>matches</th>
<th>does not match</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>wildcard</strong></td>
<td>.U.U.U.</td>
<td>CUMULUS JUGULUM</td>
<td>SUCCUBUS TUMULTUOUS</td>
</tr>
<tr>
<td><strong>character class</strong></td>
<td>[A-Za-z][a-z]*</td>
<td>word Capitalized</td>
<td>camelCase 4illegal</td>
</tr>
<tr>
<td><strong>at least 1</strong></td>
<td>A(BC)+DE</td>
<td>ABCDE ABCBCDE</td>
<td>ADE BCDE</td>
</tr>
<tr>
<td><strong>exactly k</strong></td>
<td>[0-9]{5}-[0-9]{4}</td>
<td>08540-1321 19072-5541</td>
<td>1111111111 166-54-111</td>
</tr>
</tbody>
</table>

**Ex.**  
[A–E]+ is shorthand for \((A|B|C|D|E)(A|B|C|D|E)^\)
Regular expression examples

RE notation is surprisingly expressive.

<table>
<thead>

— LexisNexis search string used by Monica Goodling
to illegally screen candidates for DOJ positions

Can the average web surfer learn to use REs?

**Google.** Supports * for full word wildcard and | for union.
Regular expressions to the rescue

http://xkcd.com/208
Can the average programmer learn to use REs?

Perl RE for valid RFC822 email addresses

http://www.ex-parrot.com/~pdw/Mail–RFC822–Address.html
Regular expression caveat

Writing a RE is like writing a program.
- Need to understand programming model.
- Can be easier to write than read.
- Can be difficult to debug.

“Some people, when confronted with a problem, think 'I know I'll use regular expressions.' Now they have two problems.”
— Jamie Zawinski (flame war on alt.religion.emacs)

Bottom line. REs are amazingly powerful and expressive, but using them in applications can be amazingly complex and error-prone.
5.4 Regular Expressions

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications
Duality between REs and DFAs

**RE.** Concise way to describe a set of strings.

**DFA.** Machine to recognize whether a given string is in a given set.

**Kleene's theorem.**

- For any DFA, there exists a RE that describes the same set of strings.
- For any RE, there exists a DFA that recognizes the same set of strings.

---

**Example:**

**RE:** $0^* \mid (0^*10^*10^*10^*)^*$

**DFA diagram:**

- **State 0:**
  - Transition on 0: State 0
  - Transition on 1: State 1

- **State 1:**
  - Transition on 0: State 2
  - Transition on 1: State 0

- **State 2:**
  - Transition on 0: State 0
  - Transition on 1: State 2

The number of 1's is a multiple of 3.

Stephen Kleene
Princeton Ph.D. 1934
Pattern matching implementation: basic plan (first attempt)

Overview is the same as for KMP.
- No backup in text input stream.
- Linear-time guarantee.

Underlying abstraction. Deterministic finite state automata (DFA).

Basic plan. [apply Kleene’s theorem]
- Build DFA from RE.
- Simulate DFA with text as input.

Bad news. Basic plan is infeasible (DFA may have exponential # of states).
Pattern matching implementation: basic plan (revised)

Overview is similar to KMP.

- No backup in text input stream.
- Quadratic-time guarantee (linear-time typical).

Underlying abstraction. Non-deterministic finite state automata (NFA).

Basic plan. [apply Kleene’s theorem]

- Build NFA from RE.
- Simulate NFA with text as input.

Q. What is an NFA?
Nondeterministic finite-state automata

Regular-expression-matching NFA.

- We assume RE enclosed in parentheses.
- One state per RE character (start = 0, accept = M).
- Red ε-transition (change state, but don't scan text).
- Black match transition (change state and scan to next text char).
- Accept if any sequence of transitions ends in accept state.

Nondeterminism.

- One view: machine can guess the proper sequence of state transitions.
- Another view: sequence is a proof that the machine accepts the text.

NFA corresponding to the pattern $( ( A * B | A C ) D )$
Q. Is A A A A B D matched by NFA?
A. Yes, because some sequence of legal transitions ends in state 11.
**Q.** Is A A A A B D matched by NFA?

**A.** Yes, because *some* sequence of legal transitions ends in state 11.

[ even though some sequences end in wrong state or stall ]

NFA corresponding to the pattern ( ( A * B | A C ) D )
Q. Is $A A A C$ matched by NFA?

A. No, because no sequence of legal transitions ends in state 11.
   [ but need to argue about all possible sequences ]

Nondeterministic finite-state automata

NFA corresponding to the pattern ( ( $A \ast B$ | $A C$ ) $D$ )
Nondeterminism

Q. How to determine whether a string is matched by an automaton?

DFA. Deterministic $\Rightarrow$ easy because exactly one applicable transition.

NFA. Nondeterministic $\Rightarrow$ can be several applicable transitions; need to select the right one!

Q. How to simulate NFA?
A. Systematically consider all possible transition sequences. [stay tuned]

NFA corresponding to the pattern $( ( A \ast B \mid A C ) D )$
5.4 Regular Expressions

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications
**NFA representation**

**State names.** Integers from 0 to $M$. 

**Match-transitions.** Keep regular expression in array re[].

**ε-transitions.** Store in a digraph $G$. 

$0 \rightarrow 1$, $1 \rightarrow 2$, $1 \rightarrow 6$, $2 \rightarrow 3$, $3 \rightarrow 2$, $3 \rightarrow 4$, $5 \rightarrow 8$, $8 \rightarrow 9$, $10 \rightarrow 11$

NFA corresponding to the pattern $( ( A \ast B \mid A \ C ) \ D )$
NFA simulation

Q. How to efficiently simulate an NFA?
A. Maintain set of all possible states that NFA could be in after reading in the first \( i \) text characters.

One step in simulating an NFA

Q. How to perform reachability?
NFA simulation demo

**Goal.** Check whether input matches pattern.

NFA corresponding to the pattern \(( ( A * B | A C ) D )\)
When no more input characters:

- Accept if any state reachable is an accept state.
- Reject otherwise.

set of states reachable : \{ 10, 11 \}
**Digraph reachability**

**Digraph reachability.** Find all vertices reachable from a given source or set of vertices.  

**Solution.** Run DFS from each source, without unmarking vertices.  
**Performance.** Runs in time proportional to $E + V$. 

```java
public class DirectedDFS {

    DirectedDFS(Digraph G, int s) {
        find vertices reachable from s
    }

    DirectedDFS(Digraph G, Iterable<Integer> s) {
        find vertices reachable from sources
    }

    boolean marked(int v) {
        is v reachable from source(s)?
    }
}
```
public class NFA
{
    private char[] re;       // match transitions
    private Digraph G;       // epsilon transition digraph
    private int M;           // number of states

    public NFA(String regexp)
    {
        M = regexp.length();
        re = regexp.toCharArray();
        G = buildEpsilonTransitionDigraph();
    }

    public boolean recognizes(String txt)
    { /* see next slide */ }

    public Digraph buildEpsilonTransitionDigraph()
    { /* stay tuned */ }
}
NFA simulation: Java implementation

```java
public boolean recognizes(String txt) {
    Bag<Integer> pc = new Bag<Integer>();
    DirectedDFS dfs = new DirectedDFS(G, 0);
    for (int v = 0; v < G.V(); v++)
        if (dfs.marked(v)) pc.add(v);

    for (int i = 0; i < txt.length(); i++)
    {
        Bag<Integer> states = new Bag<Integer>();
        for (int v : pc)
        {
            if (v == M) continue;
            if (((re[v] == txt.charAt(i)) || re[v] == '.')
                states.add(v+1);
        }

        dfs = new DirectedDFS(G, states);
        pc = new Bag<Integer>();
        for (int v = 0; v < G.V(); v++)
            if (dfs.marked(v)) pc.add(v);

    }

    for (int v : pc)
        if (v == M) return true;
    return false;
}
```

- States reachable from start by $\varepsilon$-transitions
- Set of states reachable after scanning past `txt.charAt(i)`
- Not necessarily a match (RE needs to match full text)
- Follow $\varepsilon$-transitions
- Accept if can end in state $M$
NFA simulation: analysis

**Proposition.** Determining whether an $N$-character text is recognized by the NFA corresponding to an $M$-character pattern takes time proportional to $MN$ in the worst case.

**Pf.** For each of the $N$ text characters, we iterate through a set of states of size no more than $M$ and run DFS on the graph of $\varepsilon$-transitions. [The NFA construction we will consider ensures the number of edges $\leq 3M$.]

---

NFA corresponding to the pattern $( ( A \ast B \mid A C ) D )$
5.4 Regular Expressions

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications
Building an NFA corresponding to an RE

**States.** Include a state for each symbol in the RE, plus an accept state.

NFA corresponding to the pattern \(( ( A \ast B \mid A C ) D )\)
Building an NFA corresponding to an RE

**Concatenation.** Add match-transition edge from state corresponding to characters in the alphabet to next state.

**Alphabet.** A B C D

**Metacharacters.** ( ) . * |
Parentheses. Add $\epsilon$-transition edge from parentheses to next state.

NFA corresponding to the pattern $( ( A * B \mid A C ) D )$
Building an NFA corresponding to an RE

**Closure.** Add three $\varepsilon$-transition edges for each $\ast$ operator.

NFA corresponding to the pattern ( ( A * B | A C ) D )
Building an NFA corresponding to an RE

Or. Add two $\varepsilon$-transition edges for each $|$ operator.

NFA corresponding to the pattern ( ( A * B | A C ) D )
NFA construction: implementation

**Goal.** Write a program to build the $\varepsilon$-transition digraph.

**Challenges.** Remember left parentheses to implement closure and or; remember $|$ to implement or.

**Solution.** Maintain a stack.

- ( symbol: push ( onto stack.
- $|$ symbol: push $|$ onto stack.
- ) symbol: pop corresponding ( and any intervening $|$; add $\varepsilon$-transition edges for closure/or.

NFA corresponding to the pattern $( ( A \ast B \mid A C ) D )$
NFA construction demo

( ( A * B | A C ) D )
NFA construction demo

NFA corresponding to the pattern \(( ( A \ast B \mid A C ) D )\)
private Digraph buildEpsilonTransitionDigraph() {
    Digraph G = new Digraph(M+1);
    Stack<Integer> ops = new Stack<Integer>();
    for (int i = 0; i < M; i++) {
        int lp = i;
        if (re[i] == '(' || re[i] == '|') ops.push(i);
        else if (re[i] == ')') {
            int or = ops.pop();
            if (re[or] == '|') {
                lp = ops.pop();
                G.addEdge(lp, or+1);
                G.addEdge(or, i);
            } else lp = or;
        }
        if (i < M-1 && re[i+1] == '*') {
            G.addEdge(lp, i+1);
            G.addEdge(i+1, lp);
        }
        if (re[i] == '(' || re[i] == '*' || re[i] == ')')
            G.addEdge(i, i+1);
    }
    return G;
}
NFA construction: analysis

**Proposition.** Building the NFA corresponding to an $M$-character RE takes time and space proportional to $M$.

**Pf.** For each of the $M$ characters in the RE, we add at most three $\varepsilon$-transitions and execute at most two stack operations.

NFA corresponding to the pattern $((A*B|A*C)D)$
5.4 Regular Expressions

- regular expressions
- REs and NFAs
- NFA simulation
- NFA construction
- applications
**Generalized regular expression print**

**Grep.** Take a RE as a command-line argument and print the lines from standard input having some substring that is matched by the RE.

```java
public class GREP {
    public static void main(String[] args) {
        String re = "(.* + args[0] + ".")";
        NFA nfa = new NFA(re);
        while (StdIn.hasNextLine()) {
            String line = StdIn.nextLine();
            if (nfa.recognizes(line))
                StdOut.println(line);
        }
    }
}
```

**Bottom line.** Worst-case for grep (proportional to $MN$) is the same as for brute-force substring search.
Typical grep application: crossword puzzles

% more words.txt
a
aback
abacus
abalone
abandon
...

% grep "s..ict.." words.txt
constrictor
strictor
stricture

dictionary (standard in Unix)
Industrial-strength grep implementation

To complete the implementation:

- Add multiway or.
- Handle metacharacters.
- Support character classes.
- Add capturing capabilities.
- Extend the closure operator.
- Error checking and recovery.
- Greedy vs. reluctant matching.

Ex. Which substring(s) should be matched by the RE `<blink>.*</blink>`?
Regular expressions in other languages

Broadly applicable programmer's tool.

- Originated in Unix in the 1970s.
- Many languages support extended regular expressions.
- Built into grep, awk, emacs, Perl, PHP, Python, JavaScript, ...

```bash
% grep 'NEWLINE' */*.java  # print all lines containing NEWLINE which occurs in any file with a .java extension

% egrep '^[qwertyuiop]*[zxcvbnm]*$' words.txt | egrep '.............'
```

typewritten

**PERL.** Practical Extraction and Report Language.

```perl
% perl -p -i -e 's|from|to|g' input.txt  # replace all occurrences of from with to in the file input.txt

% perl -n -e 'print if /^[A-Z][A-Za-z]*/' words.txt  # print all words that start with uppercase letter
```

do for each line
Regular expressions in Java

Validity checking. Does the input match the re?
Java string library. Use input.matches(re) for basic RE matching.

```java
public class Validate {
    public static void main(String[] args) {
        String regexp = args[0];
        String input = args[1];
        StdOut.println(input.matches(regexp));
    }
}
```

% java Validate "[\$_A-Za-z][\$_A-Za-z0-9]*" ident123
true

% java Validate "[a-z]+@[a-z]+\.(edu|com)" rs@cs.princeton.edu
true

% java Validate "[0-9]{3}-[0-9]{2}-[0-9]{4}" 166-11-4433
true

legal Java identifier
valid email address (simplified)
Social Security number
Goal. Print all substrings of input that match a RE.

% java Harvester "gcg(cgg|agg)*ctg" chromosomeX.txt
  gcgcggcgccggcggcggctg
  gcgctg
  gcgctg
  gcgcggcgccggcggcggcggctg

  harvest patterns from DNA
  harvest links from website

% java Harvester "http://(\w+\.)*(\w+)" http://www.cs.princeton.edu
http://www.princeton.edu
http://www.google.com
http://www.cs.princeton.edu/news
Harvesting information

RE pattern matching is implemented in Java's `java.util.regex.Pattern` and `java.util.regex.Matcher` classes.

```java
import java.util.regex.Pattern;
import java.util.regex.Matcher;

public class Harvester
{
    public static void main(String[] args)
    {
        String regexp = args[0];
        In in       = new In(args[1]);
        String input = in.readAll();
        Pattern pattern = Pattern.compile(regexp);
        Matcher matcher = pattern.matcher(input);
        while (matcher.find())
        {
            StdOut.println(matcher.group());
        }
    }
}
```

- `compile()` creates a Pattern (NFA) from RE
- `matcher()` creates a Matcher (NFA simulator) from NFA and text
- `find()` looks for the next match
- `group()` returns the substring most recently found by `find()`
Algorithmic complexity attacks

**Warning.** Typical implementations do not guarantee performance!

Unix grep, Java, Perl, Python

```
% java Validate "(a|aa)*b" aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaac 1.6 seconds
% java Validate "(a|aa)*b" aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaac 3.7 seconds
% java Validate "(a|aa)*b" aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaac 9.7 seconds
% java Validate "(a|aa)*b" aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaac 23.2 seconds
% java Validate "(a|aa)*b" aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaac 62.2 seconds
% java Validate "(a|aa)*b" aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaac 161.6 seconds
```

**SpamAssassin regular expression.**

```
% java RE \"[a-z]+@[a-z]+(\[a-z\.|\]+\[a-z\]+)\" spammer@x.....................
```

- Takes exponential time on pathological email addresses.
- Troublemaker can use such addresses to DOS a mail server.
Not-so-regular expressions

Back-references.

- \1 notation matches subexpression that was matched earlier.
- Supported by typical RE implementations.

\[
\begin{align*}
(\.+)\1 & \quad \text{// beriberi couscous} \\
1\$|^\((11+)\)\1+ & \quad \text{// 1111 11111 11111111}
\end{align*}
\]

Some non-regular languages.

- Strings of the form \(ww\) for some string \(w\): beriberi.
- Unary strings with a composite number of 1s: 111111.
- Bitstrings with an equal number of 0s and 1s: 01110100.
- Watson-Crick complemented palindromes: atttcggaaat.

Remark. Pattern matching with back-references is intractable.
Abstract machines, languages, and nondeterminism.

- Basis of the theory of computation.
- Intensively studied since the 1930s.
- Basis of programming languages.

**Compiler.** A program that translates a program to machine code.

- `KMP` string $\Rightarrow$ DFA.
- `grep` RE $\Rightarrow$ NFA.
- `javac` Java language $\Rightarrow$ Java byte code.

Summary of pattern-matching algorithms

Programmer.
- Implement substring search via DFA simulation.
- Implement RE pattern matching via NFA simulation.

Theoretician.
- RE is a compact description of a set of strings.
- NFA is an abstract machine equivalent in power to RE.
- DFAs, NFAs, and REs have limitations.

You. Practical application of core computer science principles.

Example of essential paradigm in computer science.
- Build intermediate abstractions.
- Pick the right ones!
- Solve important practical problems.
